FLEXIM

Technical specification

FLUXUS F601

Portable ultrasonic flow measurement of liquids

Portable instrument for non-invasive, quick flow and energy measurement with clamp-on technology for all types of piping

Features

- Transmitterconfigurable for flow and thermal energy measurement
  - Flow measurement for all acoustically penetrable fluids
  - Integrated thermal energy measurement for a typical heat and refrigerating agents
  - Temperature range -40 to+392 °F, with WaveInjector max. +1166 °F
- Precise bidirectional and highly dynamic flow measurement with the non-invasive clamp-on technology
- Calibrated transducers and transmitters with traceable certificates
- Automatic loading of calibration data and transducer detection for a fast and easy set-up (less than 5 min), providing precise and long-term stable results
- High precision at fast and slow flow rates, high temperature and zero point stability
- Portable, easy-to-use flow transmitter with 2 flow channels, multiple inputs/outputs, an integrated data logger with a serial interface
- Integrated wall thickness measurement with connectable wall thickness probe
- The transmitter is water and dust-tight (NEMA 4), resistant against oil, many liquids and dirt
- Robust, water-tight (NEMA 4) transport case with comprehensive accessories
- Li-Ion battery provides up to 25 hours of measurement operation
- User-friendly design
- QuickFix for a simple and fast transmitter fixation, e.g., on pipes

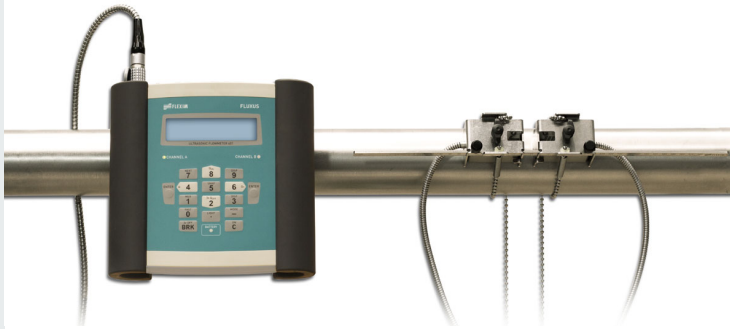
Applications

Designed for harsh environments and applicable in all areas such as drinking water and sewerage industry, power plants, producing industry, food industry and many more

Example applications:

- Operation measurements
- Data gathering in energy management and certifications according to ISO 50001
- Survey of pump performances
- Hydraulic balancing
- Verification of installed measuring systems
- Supervision of permanently installed meters, service and maintenance

FLUXUS F601



Measurement with transducers mounted with mounting frames and flow transmitter fixed to the pipe with the QuickFix pipe mounting fixture

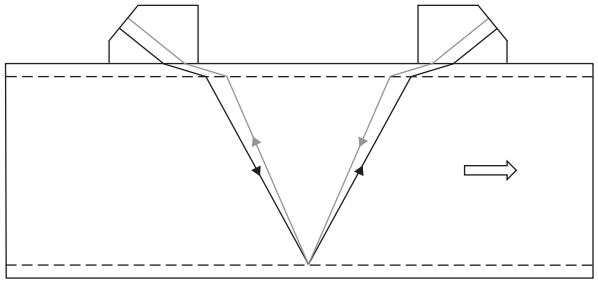
Measurement equipment in transport case

Function

Measurement principle

The transducers are mounted on the pipe which is completely filled with the fluid. The ultrasonic signals are emitted alternately by a transducer and received by the other. The physical quantities are determined from the transit times of the ultrasonic signals.

Path of the ultrasonic signal in the flowing fluid



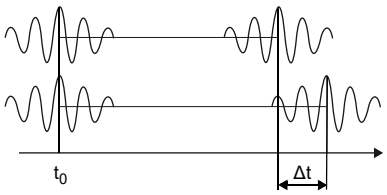
Transit time difference principle

As the fluid where the ultrasound propagates is flowing, the transit time of the ultrasonic signal in flow direction is shorter than the one against the flow direction.

The transit time difference Δt is measured and allows the flowmeter to determine the average flow velocity along the propagation path of the ultrasonic signals. A flow profile correction is then performed in order to obtain the area averaged flow velocity, which is proportional to the volumetric flow rate.

The integrated microprocessors control the entire measuring cycle. The received ultrasonic signals are checked for measurement usability and evaluated for their reliability. Noise signals are eliminated.

Transit time difference Δt



HybridTrek

If the gaseous or solid content in the fluid increases occasionally during measurement, a measurement with the transit time difference principle may no longer be possible. NoiseTrek mode will then be selected by the flowmeter. This measurement method allows the flowmeter to achieve a stable measurement even with high gaseous or solid content.

The transmitter can switch automatically between transit time and NoiseTrek mode without any changes to the measurement setup.

Calculation of volumetric flow rate

$$\dot{V} = k_{Re} \cdot A \cdot k_a \cdot \frac{\Delta t}{2 \cdot t_\gamma}$$

where

- $\dot{V}$ - volumetric flow rate
- k_{Re} - fluid mechanics calibration factor
- A - cross-sectional pipe area
- k_a - acoustical calibration factor
- Δt - transit time difference
- t_γ - average of transit times in the fluid

Number of sound paths

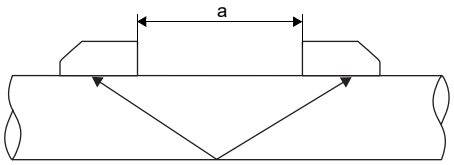
The number of sound paths is the number of transits of the ultrasonic signal through the fluid in the pipe. Depending on the number of sound paths, the following methods of installation exist:

- **reflect arrangement**
  The number of sound paths is even. The transducers are mounted on the same side of the pipe. Correct positioning of the transducers is easier.
- **diagonal arrangement**
  The number of sound paths is odd. The transducers are mounted on opposite sides of the pipe.
- **direct mode**
  Diagonal arrangement with 1 sound path. This should be used in the case of a high signal attenuation by the fluid, pipe or coatings.

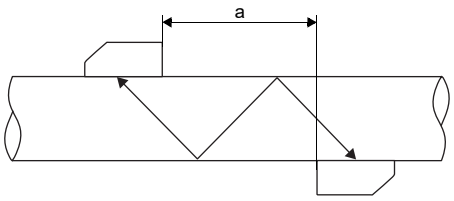
The preferred method of installation depends on the application. While increasing the number of sound paths increases the accuracy of the measurement, signal attenuation increases as well. The optimum number of sound paths for the parameters of the application will be determined automatically by the transmitter.

As the transducers can be mounted with the transducer mounting fixture in reflect arrangement or diagonal arrangement, the number of sound paths can be adjusted optimally for the application.

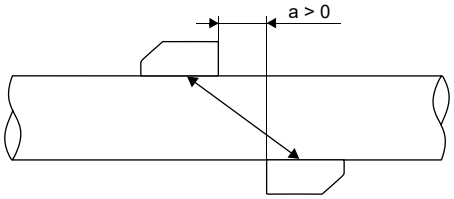
Reflect arrangement, number of sound paths: 2



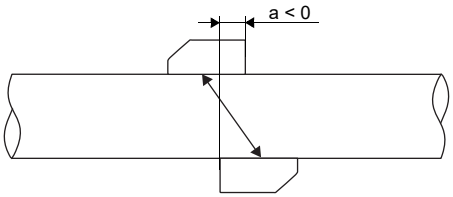
Diagonal arrangement, number of sound paths: 3



Direct mode, number of sound paths: 1



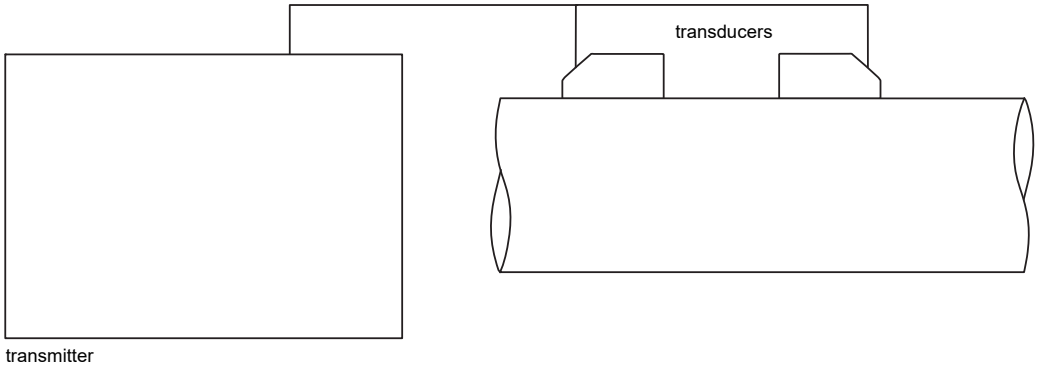
Direct mode, number of sound paths: 1, negative transducer distance



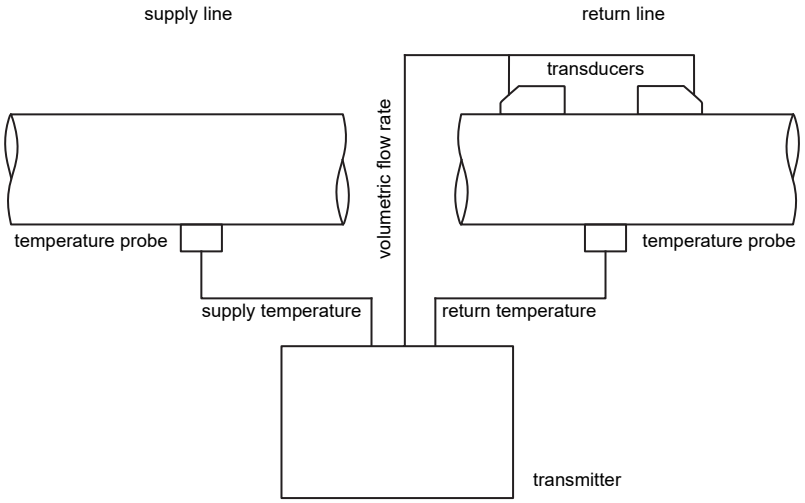
a - transducer distance

Typical measurement setup

Example of a reflect arrangement



Example of a thermal energy rate measurement measuring the volumetric flow rate in the return line



Transmitter

Technical data

		FLUXUS F601
		
design		portable
measurement		
measurement principle		transit time difference correlation principle, automatic NoiseTrek selection for measurements with high gaseous or solid content
flow velocity	ft/s	0.03 to 82
repeatability		0.15 % of reading ±0.02 ft/s
fluid		all acoustically conductive liquids with < 10 % gaseous or solid content in volume (transit time difference principle)
temperature compensation		corresponding to the recommendations in ANSI/ASME MFC-5.1-2011
measurement uncertainty (volumetric flow rate)		
measurement uncertainty of measuring system[1]		±0.3 % of reading ±0.02 ft/s includes calibration certificate traceable to NIST
measurement uncertainty at the measuring point[2]		±1 % of reading ±0.02 ft/s
transmitter		
power supply		• 100 to 230 V/50 to 60 Hz (power supply unit: IP40, 32 to 104 °F) • 10.5 to 15 V DC (socket at transmitter) • integrated battery
integrated battery • operating time	 h	Li-Ion, 7.2 V/6.2 Ah • > 14 (without outputs, inputs and backlight) • > 25 (1 measuring channel, ambient temperature > 50 °F, without outputs, inputs and backlight)
power consumption	W	< 6 (with outputs, inputs and backlight), charging: 18
number of measuring channels		2
damping	s	0 to 100 (adjustable)
measuring cycle	Hz	100 to 1000 (1 channel)
response time	s	1 (1 channel), option: 0.07
housing material		PA, TPE, AutoTex, stainless steel
degree of protection		NEMA 4
dimensions	in	see dimensional drawing
weight	lb	4.6
fixation		QuickFix pipe mounting fixture
ambient temperature	°F	14 to 140
display		2 x 16 characters, dot matrix, backlight
menu language		English, German, French, Dutch, Spanish
measuring functions		
physical quantities		volumetric flow rate, mass flow rate, flow velocity, thermal energy rate (if temperature inputs are installed)
totalizer		volume, mass, optional: thermal energy
calculation functions		average, difference, sum
diagnostic functions		sound speed, signal amplitude, SNR, SCNR, standard deviation of amplitudes and transit times
communication interfaces		
service interfaces		• RS232 • USB (with adapter)
process interfaces		• Modbus RTU (optional)
accessories		
serial data kit • cable • adapter	 	 RS232 RS232 - USB
software		• FluxDiagReader: download of measured values and parameters, graphical presentation • FluxDiag (optional): download of measurement data, graphical presentation, report generation
adapter		AO5, AO6, AO7, AO8, AI1, AI2
transport case		dimensions: 19.7 x 15.7 x 7.5 in
data logger		
loggable values		all physical quantities, totalized values and diagnostic values
capacity		> 100 000 measured values

		FLUXUS F601
outputs		
		The outputs are galvanically isolated from the transmitter.
number		see standard scope of supply, max. on request
• switchable current output		
		The switchable current outputs are menu selectable all together as passive or active.
range	mA	4 to 20 (3.2 to 24)
accuracy		0.04 % of reading ±3 µA
active output		U_{int} = 24 V, R_{ext} < 500 Ω
passive output		U_{ext} = 8 to 30 V, depending on R_{ext} (R_{ext} < 900 Ω at 30 V)
• frequency output		
range	kHz	0 to 5
open collector		24 V/4 mA
• binary output		
optorelay		26 V/100 mA
binary output as alarm output		
• functions		limit, change of flow direction or error
binary output as pulse output		
• functions		mainly for totalizing
• pulse value	units	0.01 to 1000
• pulse width	ms	1 to 1000
inputs		
		The inputs are galvanically isolated from the transmitter.
number		see standard scope of supply, max. 4
• temperature input		
type		Pt100/Pt1000
connection		4-wire
range	°F	-238 to +1040
resolution	K	0.01
accuracy		±0.01 % of reading ±0.03 K
• current input		
accuracy		0.1 % of reading ±10 µA
passive input		R_{int} = 50 Ω, P_{int} < 0.3 W
• range	mA	-20 to +20
• voltage input		
range	V	0 to 1
accuracy		0.1 % of reading ±1 mV
internal resistance		R_{int} = 1 MΩ

Wall thickness measurement (optional)

The pipe wall thickness is an important pipe parameter which has to be determined exactly for a good measurement. However, the pipe wall thickness often is unknown.

The wall thickness probe can be connected to the transmitter instead of the flow transducers and the wall thickness measurement mode is activated automatically.

Acoustic coupling compound is applied to the wall thickness probe which then is placed firmly on the pipe. The wall thickness is displayed and can be stored directly in the transmitter.
